

THOR mk II

This is the new version of the integrated amplifier Thor, designed in Sweden by Mike Bladelius.

Now it has even more of the earth rattling power to transform sound into music and feeling into emotion.

Thor derives its immense strength from a massive 1800 VA custom designed, toroidal transformer and 80000 micro farads of filter capacitance. The noise floor is extraordinary low and Thor yields a seemingly endless supply of power for any load. Thor features a fully balanced design that delivers dynamic, detailed and lifelike presentation of music.

Single ended input-stage drives 16 high power beta matched output devices to provide 165 watts per channel into 8 ohms.

The DC-coupled design is fully balanced throughout the entire signal path. Using a balanced design ensures the lowest noise and distortion achievable.

Seven analogue input pairs are provided for use with 2 balanced (XLR) and 5 single-ended (RCA) sources. A pair of pre-amp outputs allows connection to an external power amplifier while using the Thor as a pre-amplifier.

Input sensitivity can be adjusted for each input to accommodate different levels while maintaining the same output level as you switch inputs. The Home Theatre input allows you to use the Thor in a multichannel setup with just a push of a button.

Technical specifications

2x165W 8 ohm < 0.1 % distortion
Frequency range DC -100 kHz +/- 1 dB
Input impedance 50 Kohm
1800 VA custom made, special core transformer
Large capacitor bank of 80000 uF
Single-ended coupled input stage
High power output devices
Speaker terminals are the highly acclaimed WBT
